

Highlights

Assessment: GDMIS meets with the client to discuss use of the GIS system to tailor the system to their needs.

Acquisition: Purchase of a state of the art computer system, software, and any required peripherals such as printers, tape backups or scanners.

Collection: Data mining and collection based on the needs of the client.

Organization: Database creation, making it easy for the client to access provided data.

Set up: Delivery and any required networking are provided by GDMIS as part of the GIS package.

Training: GDMIS provides experts with years of experience to provide on-site training for your agency technical staff and GIS professionals.

GDMIS prepared a fully integrated GIS for the Cape May National Wildlife Refuge. We purchased computer hardware and software and assembled a database from existing digital sources. GDMIS gathered the data, rectified each layer, created a database management system, and delivered a complete GIS to Cape May. The result is a functioning GIS that will

assist the Refuge biologists with resource delineation that will facilitate resource analysis, wildlife tracking, and management decisions. The refuge will also be able to identify areas with dangerous fuel loads and conduct wildlife habitat and fuel reduction prescribed burns. Along with the delivery of the GIS, GDMIS trained Refuge personnel in ArcGIS, as well as system operation, backup and maintenance.

Project Delivery Performance: Work on this project proceeded according to management plans, on budget and on schedule. In addition, GDMIS went above and beyond the expected hours of training to be sure that Refuge personnel were comfortable with data manipulation as well as with simple hardware operation.

Quality, Service or Cost Problems: Data layers were collected from many sources and as a result are defined by many different formats. GDMIS took the time necessary to convert all layers to compatible formats so that the GIS operated smoothly and easily when delivered to Cape May.
